VBA TextBox

I have enabled MultiLine and EnterKeyBehaviour in the properties window of the textbox so I can type multiple lines in my textbox. On sheet 1 is where my formula lies. Once the user selects the cell shown in the example sheet, it should then bring up the user form. Changing the event from exit to afterupdate corrected this. But if I had a dynamic range established and scrolled over to view the S&P 500's prices for this past February, I would need a Min and Max range of around 650 to 850. It just places a square symbol in the place that enter should have been pressed and the text should have been split into separate lines. This is creating a lot of problems! Is there any way to manually change the scope of a named range? I need to create a macro which auto-populates a master worksheet from the individual user sheets in a shared workbook. But I did so in a beta file (test file), then user should then be able to select an item and the cells on the user entry screen would then get populated. =COUNTIF(Sheet2!B:B,(VLOOKUP(A,Sheet2!B:B,(VLOOKUP(A,Sheet2!B:B,N,13,FALSE)=501:1000))=COUNTIF(Sheet2!B:B,(VLOOKUP(A,Sheet2!B:B,N,13,FALSE)=501:1000))

How can I get the separate lines of text in my textbox to be properly displayed in a cell? So in sense, my formula should look like =IF (E7=1,=VLOOKUP(A10,"Clean Prices"!\$A\$2:\$C\$58,2,FALSE),=VLOOKUP(A10,"Clean Prices"!\$A\$2:\$C\$58,3,FALSE)) But it doesn't work. However when I copy the formula down it keeps returning the exact same value as the first cell. Is it possible to nest a vlookup in an if statement? If I enter a formula in each individual cell it returns the correct value. If anyone could provide code which would allow me to do this I would be grateful Thanks Colin Thought I'd start this topic since there seem to be a number of topics where the answer seems to be to use one of the above rather than other. I know that I can use named ranges to display various sections of data - month by month, or quarter by quarter, for example. I have a lot of named ranges that the scope of the named range has changed to a new sheet. I started off using the exit event but ran into 2 problems. Thanks StanSz I have never really used VBA and so am completely stuck at this problem. If this is not then it would be fien to update every time the workbook is opened. Login form containing username and password fields. I have workbook in which I want to save a specific worksheet to a new file with only the values saved - all data in this worksheet are references to cells on another worksheet, which is using VLOOKUP to pull data from a database. Full Excel VBA Course - Beginner to Expert (35% Discount) I'm trying to use a textbox entry on a userform to populate another textbox (or label) on the same form based on a Vlookup to a dynamic named range. I just honestly don't know how to retrieve that info before deleting that file. Im looking for a vlookup formula which will give me the maximum number from a list which contains multiple matches, i.e. Lookup number 1 from column A, then give me the largest number from column B example table: A B ---- 1 5 2 2 1 11 3 2 4 5 the result would be 11 thanks all! I have entered a vlookup formula in a cell and it returns the correct value from the other worksheet. Now push in right (or at least better) direction. Code:Sub Button1_Click() Set UserForm1.combobox1.List = Sheets("Sheet1").Range("MyRange") UserForm1.Show End Sub I am very new to vba, so please excuse my ignorance, any help would be greatly appreciated regards Jim H Guys, Could you be so kind as to provide some code that will enable me to display a text box on a userform rounded up to 1 decimal place, the user then, depending on which item clicked, then gets shown the next window with a table and info on it. I have a workbook that has recently changed on me and is causing a lot of grief. Is there a way to have these Min & Max values adjust automatically depending on the values being displayed ?? I would also like to be able to edit/update the form and update the information on the spreadsheet accordingly. This resulted in me using the exit event for all except the last textbox in the frame that used afterupdate instead I then discovered that the exit events didn't kick in if, instead of tabbing out of the field, I deliberately placed focus in a control elsewhere on the form. Thanks Regarding Charts in Excel: Is there a way to have the Min and Max values adjusted dynamically for the Scale of the values being displayed ?? I have a very simple pivot table that I am trying to use as a data source for a VLOOKUP request. I have the following: 1. Thank to previous posts on that board tackling that issue, I was able to find how to proceed to reduce the file back to its normal size. Personally I think this is a really tricky challenge and any help with doing this would be extremely appreciated. One sheet is the user entry sheet called User Entry Screen. The user enters a currency value and once they leave the control, then a protected textbox next to it shows the corresponding value in SEK. If the value in the cell is anything else, I want to lookup the value for the house in the third column. Private Sub CommandButton1_Click() TextBox2.Value = Val(TextBox1.Value) / Range("O26").Value End Sub Hi, I have the following code to put data from a VBA userform into Excel Dim Sh As Worksheet Dim Rng As Range Set Sh = ActiveSheet Set Rng = Sh.Range("A65536").End(xlUp).Offset(1, 0) With Rng.Cells(1, 1) = Surname.Text.Cells(1, 2) = forename.Text.Cells(1, 3) = datein.Text.Cells(1, 4) = origin.Text.Cells(1, 5) = Addressee.Value.Cells(1, 6) = usual.Value.Cells(1, 7) = dateout.Text.Cells(1, 8) = permission.Value.Cells(1, 9) = requestview.Value.Cells(1, 11) = Invoice.Value.Cells(1, 12) = notes.Text.Cells(1, 13) = datecompleted.Text.Cells(1, 14) = holdsend.Value.Cells(1, 15) = fee.Text.Cells(1, 16) = notes2.Text.Cells(1, 17) = dateseen.Text.Cells(1, 18) = invoicesent.Text.Cells(1, 19) = Paid.Text.Cells(1, 20) = CompleteValue End With What I want to do next is click on the surname on the spreadsheet and call up the userform with the fields completed for that person. But when the value of these ranges vary greatly from section to section I end of having to manually go and adjust the Min and Max values of the chart scale. I have a UserForm with several fields on it: 5 are 'required' and the other 6 are 'optional'. I have a userform with frames containing textboxes. Each worksheet will be identical, using columns A-I with row 1 having the headings: Date, Name, Reference, Value, Price, Age, Purchased?, Destination, Add. Now I have another situation. Coding for username and password fields, which, If the login is successful, takes me to DATA Entry Form, Otherwise shows message "Invalid Login". I added a print button to my userform Code:Private Sub btn1_Click() UserForm1.PrintForm End Sub This prints out the userform as I would like, however it autoprnts to the default printer and doesn't allow any printing options so I can't select to "print to one page". Any suggestions? Sub CopyMe() Dim SaveMeAs As String SaveMeAs = Sheets("Sheet1").Range("B2").Text Sheets("Sheet3").Copy ActiveWorkbook.SaveAs Filename="C:\My Documents\ & SaveMeAs End Sub Hello Everybody, I am hoping for some assistance. If possible I would like the macro to run every time data is entered into one of the individual worksheets. Only need like 65.3 as an answer not 65.27756942 This is the code ive used. Thank you very much for your help. If so, is there any special syntax I need to use? For example, if I was looking at a graph of the S&P 500's prices last November, a Min and Max range of 750 to 1200 would be fine. Is there anyway then to open the file or to reduce its size without opening it (through magics...)? I would like to populate CanType from Can and GrossWt from Truck (named ranges CanInfo and TruckInfo). So as of now it is only printing out half my form and cutting off the rest. Hi, can anyone help me with the below... Hi, This is a very basic question, but i have been struggling for hours, so i must ask. Anyway, I have 2 columns of data in an excel sheet and I wish to add this to a userform so that the userform displays the 2 columns beside each other with headings, like a table, without deleting the named range and recreating it? Where am i going wrong... Unfortunately, every time I do it I get the result #NA. When a user clicks on a line in the listbox I want to automatically copy the text in the 3rd column of the selected line to the textbox, could you guys document in this topic when you would/must use the exit rather than the afterupdate event (or vice-versa). Data entry form I want to do the following: 1. I'll post up further comments as I am trying to work my way through it! Thanks, Jag Thnx for your help man. In a cell, I want it to look at sheet 2 column B and look for instances of "A", then I want it to look in the same row it found "A" and look at the value in column "N" and evaluate if there is an amount. I would also like the user to select a row on the table and then be able to bring up another table depending on the row selected...basically so that the user can draw deeper into the information that they require. What modifications do I make to this to get this to work per above requirements? The user should then be able to select a particular row and insert it into the specified cell. Here is what I have.... it calculates the number entered in textbox1 and divides it by a value that changes in cell O26 but the answer is in about 8 or more decimal places. This is in the same workbook but different sheets. (I launch the userform from a button on the sheet) Where must I place the code? The real file has become so big (103MB!) that Excel cannot even open it anymore! The file contains archive info that we do not have anywhere else, and will this code work? the next sheet is the tables sheet where my tables are held. I can't figure out how to route the user back to the UserForm, to enter the 'missed' data. It's for a house cleaning price list, with two sets of prices. My question then is ... Thought I'd kick off with my 2 cents' worth. 26) Excel VBA Course - From Beginner to Expert 200+ Video Lessons 50+ Hours of Instruction 200+ Excel Guides Become a master of VBA and Macros in Excel and learn how to automate all of your tasks in Excel with this online course.

09/07/2015 - When creating Excel userforms it seems like a good idea to check the data going into the form before adding it to your sheet. Once the data is in your sheet you can use other methods like conditional formatting to highlight errors or unwanted data. But it's good to stop the errors before they get into your sheet. Các vòng lặp trong VBA như: vòng lặp For, vòng lặp Do While, vòng lặp Do Until, vòng lặp For Each. Kèm theo đó là những ví dụ đơn giản nhất. Estamos muy acostumbrados a trabajar con las últimas versiones de Excel (2007 o 2010) donde podemos asignar formatos condicionales con más de tres condiciones sobre una celda; sin embargo, no hace mucho esta posibilidad no existía en el estándar, y debíamos construimos un código o macro que ejecutara y diera los formatos deseados. Aún hoy siguen quedando ... 21/08/2015 - Carrying on with the Excel form I created in an earlier post, I'm adding code to allow us to insert new records into any row of the table (not just at the bottom of the table), delete records and update existing records. 24/12/2021 - vba初心者です。ユーザーフォームでカレンダーを作成しました。ボタン一つに日付を入れるところまではできたのですが、クリックするたびに色が変わるマクロが思いつきません。コマンドボタン一つずつにマクロを紐づけたいのでしょうか。2. Cách tạo UserForm trong VBA. Để tạo UserForm thì bạn thực hiện theo các bước như sau: 1. Mở Visual Basic Editor. 2. Click Insert -> UserForm. 3. Một form xuất hiện và kèm theo đó là hộp thoại Toolbox (2), đây là hộp đựng các điều khiển ActiveX Control mà bạn có ... 01/12/2019 - Simple, Dynamic and Fully Automated Form in Excel - Step-by-Step Tutorial In this tutorial, we will learn how to create data entry form based on User Form in Excel. We will utilize the Excel sheet as database and User Form to enter the data and transfer it to Database sheet. 30/01/2018 - How to populate textbox based on combobox selection on UserForm in Excel? Supposing you have a table contains a Name and a Staff number column as below screenshot shown. Now you need to create a Userform embedded with a combo box which collecting all names inside and a text box which will populate corresponding staff number when selecting ... 03/01/2022 - Hi All. Please note that at the Chandoo.org Forums there is Zero Tolerance to Spam. Post Spam and you Will Be Deleted as a User. Hui... 22/06/2013 - Excel VBA - Order and Inventory Management- Excel 2013.In this project I'm going to show you how you can use userforms to run a complete order and inventory system. You will learn how to use a userforms with dependent lists looking up data and transferring that data to worksheets.If you want to learn more about Microsoft Excel VBA programming this is a great ... 25/04/2016 - Timers In Excel Tools For Excel (Free Add-ins) Tracking Workbook Opens And Closes TreeView Control, Using To Display Folders And Files TrimToChar Function TrimToNull Function Transposing A Range With Formulas. U. Union Method. A Better Way Unique Entries, Counting Unique Identifiers (GUIDs) Unique Ranks Unique Random Numbers 01/12/2019 - Simple, Dynamic and Fully Automated Form in Excel - Step-by-Step Tutorial In this tutorial, we will learn how to create data entry form based on User Form in Excel. We will utilize the Excel sheet as database and User Form to enter the data and transfer it to Database sheet. EXCEL COUNTIF function - Count cells that are not blank, greater/less than, or contain a specific value; Excel COUNTIFS function - Count cells with multiple criteria - AND logic and OR logic; Excel data validation: add, use, copy and remove data validation in Excel; Excel drop down list: create, edit, remove and more advanced operations 20/12/2018 - Find the links to helpful and free Excel tutorials all in one place ... I have tried VLOOKUP, HLOOKUP INDEX and MATCH, but I dont get the function of it.I ... coded in the sheet. I have exit, add, and cancel control buttons on userform. The rest I have tried to code in the userform, combobox, textbox etc. All I want is a simple ... 09/07/2015 - When creating Excel userforms it seems like a good idea to check the data going into the form before adding it to your sheet. Once the data is in your sheet you can use other methods like conditional formatting to highlight errors or unwanted data. But it's good to stop the errors before they get into your sheet.
